EXPERIMENT 05

Reports dashboards and custom pages

Aim

Build usable reports and a custom dashboard that show accurate circulation information to authorized users.

Procedure

1. Create Books_Catalogue, Copies_Register, Members_Register and All_Loans reports from their respective forms. Display useful columns rather than every field. Keep personal member data out of the public catalogue.

2. Create Open_Loans with Status equal to Issued; Overdue_Loans with Status equal to Issued and Due_Date before today; and Returned_Loans with Status equal to Returned. Use a date filter that reevaluates relative to the current date.

3. Show Loan_No, copy accession, title, member, issue date and due date in circulation reports. Add conditional formatting for overdue rows and sort by Due_Date ascending. Use explicit empty-state text.

4. Create Library_Dashboard using the page builder or UI Builder available in the account. Add four summary panels, an overdue list, and a monthly issue chart. Add Issue Book and Return Book navigation actions for librarians.

5. Build a member page only if member access is configured securely. Its counts and reports must use the same authorized member scope. Do not rely on a hidden button or user-selectable filter for access control.

Implementation and verification

6. Testdesktopand narrow-screenlayouts.Ensurelabels, keyboard focus, contrast, and date formats are understandable. Remove dashboard components that do not serve a clear task.

Metric	Definition
Total titles	Count of Books records, not copies.
In service copies	Count of Book_Copies where Service_Status is In Service.
Open loans	Count of Loans where Status is Issued.
Overdue loans	Open loans with Due_Date earlier than today.
Monthly issues	Count of loans grouped by Issue_Date month, including subsequently returned loans.

Testing and evidence

E05: report definitions and dashboard screenshots. With one open loan due yesterday, one due today and one returned late, expect Open = 2 and Overdue = 1. Cross-check each panel against the filtered source report. Test zero records, long titles, and member access to a direct report URL.

Implementation and interpretation

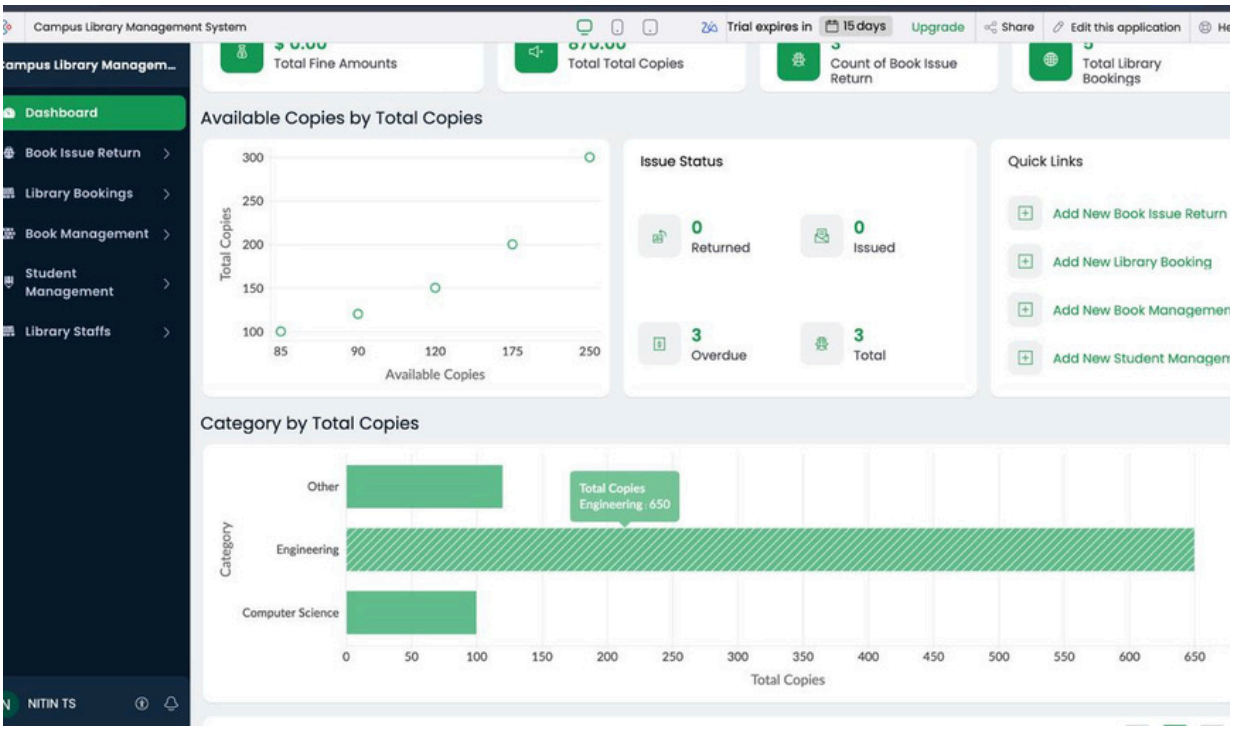

A chart should answer a specific library question. Category distribution describes the catalogue; monthly issues describe circulation activity. Neither chart alone proves that overdue counts or member access are correct. Verify the underlying report filters and the meaning of each measure.

Application images and explanation

Category wise book distribution

Supplied application screenshot from the uploaded library document.

Monthly book issue trend

Supplied application screenshot from the uploaded library document.

A chart should answer a specific library question. Category distribution describes the catalogue; monthly issues describe circulation activity. Neither chart alone proves that overdue counts or member access are correct. Verify the underlying report filters and the meaning of each measure.

Result

Expected result and verification criteria. Reports and panels reconcile with source records, the due-today boundary is correct, and permitted users can complete their tasks without exposure of another member's data.
