EXPERIMENT 09

Zia and built in analytics

Aim

Evaluate available Zia assistance and Creator analytics while checking accuracy, privacy, permissions and account-specific availability.

Procedure

1. Inspect the account’s Zia configuration with an authorized administrator. Record available features, provider, data center, required setup and applicable usage limits. Do not assume a feature is available because another Zoho product advertises it.

2. In a development copy, request a small form or Deluge draft. Example prompt: “For Loans, reject a new issue if the selected member is inactive or already has three Issued loans. Use Members.Active and Loans.Member. Do not send messages.”

3. Compare generated output with the field dictionary and Experiment 6. Check field link names, event context, null handling, authorization and concurrency assumptions. Keep a reviewed correction log and compile before enabling.

4. Build native reports for monthly issues, popular titles and overdue loans. Reconcile their aggregates with hand-counted fixtures. These are Creator reporting features; they do not require a claim that Zia generated or validated them.

5. If an AI prediction feature is available, design an optional late-return experiment using only approved de-identified history. Define the target as Return_Date after Due_Date. Split data chronologically and exclude Return_Date, final fines and other future information from predictors.

Implementation and verification

6. **I**fanatural-language analyticsfeature suchas Ask Ziaisrequired, first verify whether it belongs to a separately configured Zoho Analytics or BI integration. Record that dependency and its permissions. If unavailable, complete native analytics and label the AI exercise design-only.

AI evaluation

Check	
Correctness	Generated logic compared with deterministic tests T01 to T12.
Privacy	No real names, emails, tokens or circulation history in prompts.
Analytics	Totals agree with source records; no unauthorized rows appear.
Prediction	Dataset size, time split, baseline, precision and recall reported if actually trained.
Human control	No automated borrowing denial or fine imposed by an unreviewed model.

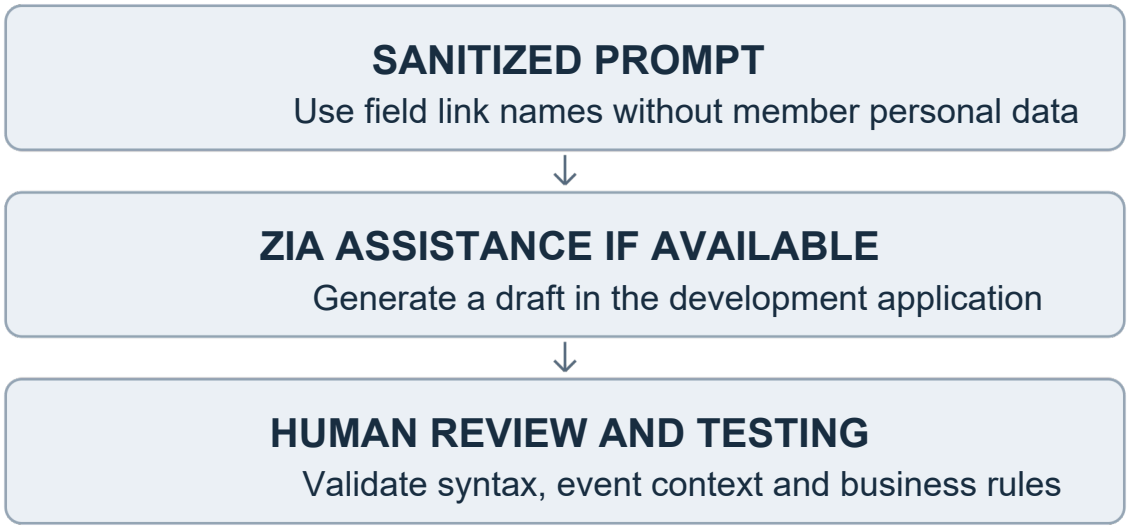

Evidence

E09: feature availability record, sanitized prompt and output, human corrections, chart screenshots and reconciliation. Small lab fixtures cannot establish prediction quality. Do not report model accuracy without an actual held-out evaluation.

Implementation and interpretation

The supplied chart is an application analytics screenshot, not evidence of a Zia session. The AI diagram explains the intended evaluation flow. Account availability, prompt output and accuracy still require direct verification in Creator.

Illustrative process diagram

Generated explanatory diagram. It is not a screenshot of an executed workflow.

The supplied chart is an application analytics screenshot, not evidence of a Zia session. The AI diagram explains the intended evaluation flow. Account availability, prompt output and accuracy still require direct verification in Creator.

Result

Expected result and verification criteria. Available assistance is evaluated against concrete tests and native metrics reconcile correctly. Unavailable AI features, insufficient training data and separate analytics dependencies are explicitly identified.
