EXPERIMENT 15

Career pathways and future of low code

Aim

Prepare a career report and presentation outline connecting low code skills to practical software responsibilities and likely future developments.

Procedure

1. Identify roles that apply to the completed library project. Separate business analysis, application development, integration, testing, administration and architecture rather than treating low code as a single job title.

2. Review current role descriptions or employer job postings when preparing a market-specific report. Record employer, role, location, publication or access date and requested skills. Do not infer salaries or job demand from product documentation.

3. Map each role to portfolio evidence from this record. Prepare a sanitized demo with a data model, one workflow, a denied-access test, a recoverable integration failure and a release checklist.

4. Write a report covering role responsibilities, required skills, learning gaps, a development plan and future outlook. Support current capability claims with sources; label forecasts as reasoned expectations.
5. Prepare the eight-slide outline below and rehearse a five-minute explanation. Show evidence of reasoning and testing, not only screenshots of a working form.

Pathway	Skills to develop	Portfolio evidence
Low code developer	Data models, Deluge, usable forms	Experiments 4 to 6
Business analyst	Requirements and process mapping	Experiments 1 and 3
Integration developer	REST, OAuth, retries, contracts	Experiments 7 and 14
QA or administrator	Testing, permissions, recovery	Experiments 8, 11 and 12
Solution architect	Tradeoffs, scale and governance	Experiments 10 and 13

Implementation and verification

Report discussion

AI assistance may reduce routine form and script drafting, while increasing the value of clear requirements, verification and governance. Hybrid applications create a need for API, data and security skills. These are reasoned career implications of the documented capabilities, not guaranteed employment forecasts.

Presentation outline

1. Library problem and goals. 2. Low code architecture. 3. Data model and circulation demo. 4. Validation and negative tests. 5. Integration and failure recovery. 6. Security and governance. 7. Career skill map. 8. Future outlook and a personal learning plan.

Learning plan and evidence

Suggested 12-week plan: weeks 1 to 3 data modelling and Deluge; 4 to 6 APIs and OAuth; 7 to 9 testing and access control; 10 to 12 release management and a documented portfolio. E15 should include the written report, completed slides or slide notes, source log and an honest skills self-assessment.

Implementation and interpretation

A useful portfolio shows both successful behavior and prevented failures. Explain why the data model was chosen, how access was tested, what failed during integration and how a release can be recovered. Match these examples to the responsibilities of the desired role.
